1. Introduction

The User Guide is for system administrators to remotely access computers with BMC (Baseboard Management Controllers) and IPMI (Intelligence Platform Management Interface). System administrators may easily monitor system conditions or manage issues of remote computers via the web-based interface, a web browser on the Internet.

Note: All screenshots in this document are provided for illustrative purpose only, and may be different from the actual product.

Abbreviation	Definition
AD	Active Directory
BIOS	Basic Input Output System
BMC	Baseboard Management Controller
DHCP	Dynamic Host Configuration Protocol
DIMM	Dual-Inline-Memory-Modules
FRU	Field Replaceable Unit
FQDN	Fully Qualified Domain Name
IPMI	Intelligent Platform Management Interface
KVM	Keyboard, Video, and Mouse
LDAP	Lightweight Directory Access Protocol
ME	Intel Management Engine
NCSI	Network Controller Sideband Interface
NTP	Network Time Protocol
PEF	Platform Event Filter
POST	Power On Self-Test
PSU	Power Supply Unit
RADIUS	Remote Authentication Dial In User Service
SEL	System Event Log
SMTP	Simple Mail Transfer Protocol
SNMP	Simple Network Management Protocol
SSL	Secure Sockets Layer
TSIG	Transaction Signature
VLAN	Virtual Local Area Network

Terminology

2. HTML5 Web GUI

Logging in to Web using IPMI user

In order to login the IPMI, you must have a valid Username and a Password. Both fields are required.

ASROCKRACI	<
Username	
Password	
Remember Username	
Sign me in	
I forgot my password	
Language	
English	۲

Login Page

The default username and password are both "admin". It is recommended to change the username and password after your first login.

Username: Enter your username in this field.

Password: Enter your password in this field.

Remember Username: Check this option to remember your login credentials.

Sign me in: After entering the required credentials, click the **Sign me in** to login to Web GUI.

I Forgot my Password: If you forget your password, you can generate a new one using this link. Enter the username, click on **Forgot Password** link. This will send the newly generated password to the configured Email-ID for the user.

Language: Select the language of Web GUI, you can choose English, Traditional Chinese or Simplified Chinese.

Logging in to Web using SSL mutual authentication

You can also login to the IPMI via SSL mutual authentication without entering username/password.

Before you login as SSL mutual authentication, ensure that:

- 1. Upload CA certificate(.pem), server certificate(.pem) and server private key(.pem) to BMC
- 2. Install the client certificate(.p12) into the browser
 - Chrome: Using "//settings/" to open Manager certificates to import the certificate.
 - **IE11:** Using "Tools>Internet Options>Certificates" to import the certificate.
 - Firefox: Using "Tools > Options > Advanced > Certificates" to import the certificate.

3. Login to IPMI using the link <u>https://[IP address]:[mutual port number]</u>.

Note:

- 1. The default mutual port number is 4433. You can modify it in **Services** page.
- 2. If you want to generate SSL certificate yourself, please follow the steps below.
 - Install OpenSSL in your Linux machine.
 - Generate CA certificate:
 - (1) Type openssl genrsa -out ./private/ca.key 1024 to generate a private key
 - (2) Type **openssl req -new -x509 -days 365 -key ./private/ca.key -out ./certs/ca.crt** to generate a certificate file(contain public key)
 - (3) Type cat ./certs/ca.crt > ./certs/ca.pem to transfers the file format to .pem.
 - Generate server certificate:
 - (1) Type **openssl genrsa -out ./private/server.key 1024** to generate a server key.
 - (2) Type **openssl req -new -key ./private/server.key -out ./certs/server.csr** to generate the csr file.
 - (3) Type openssl x509 -req -days 365 -in ./certs/server.csr -CA ./certs/ca.crt -CAkey ./private/ca.key -set_serial 01 -out ./certs/server.crt to sign the file and generate a server certificate
 - (4) Type cat ./certs/server.crt > ./certs/server.pem to transfers the file format to .pem.
 - (5) Type cat ./private/server.key > ./private/server_key.pem to transfers the file format to .pem.
 - Generate client certificate:
 - (1) Type openssl genrsa -out ./private/client.key 1024 to generate a client key.
 - (2) Type **openssl req -new -key ./private/client.key -out ./certs/client.csr** to generate the csr file.
 - (3) Type openssl x509 -req -days 365 -in ./certs/client.csr -CA ./certs/ca.crt
 -CAkey ./private/ca.key -set_serial 02 -out ./certs/client.crt to sign the file and

generate server certificate.

- (4) Type cat ./certs/client.crt > ./certs/client.pem to transfers the file format to .pem.
- (5) Type cat ./private/client.key >> ./certs/client.pem to export the file.
- Type openssl pkcs12 -export -in ./certs/client.crt -out ./certs/client.p12 -name "Client Name" -inkey ./private/client.key to transfer client certificate format to p12 for browser.

System Requirements

- Client machine with 8GB RAM.
- If the client machine has 4GB RAM, there will be lag in Video/keyboard/mouse functionality.

Supported Browsers

- Chrome latest version.
- IE11 and above.
- Firefox (with limited support).

Note:

- 1. It is advisable to use Chrome or IE for H5Viewer, since Firefox has its own memory limitations.
- 2. Some icons may not appear on the IE browser screen.
- 3. Once you login to the application, it is recommended not using the following options.
 - Refresh button of the browser
 - Refresh menu of the browser
 - Back and Forward options of the browser
 - F5 on the keyboard
 - Backspace on the keyboard

3. Web GUI Overview

3.1 Menu bar

The menu bar displays the following items.

- Power Status / UID Status
- Dashboard
- Sensor
- System Information
- Logs & Reports
- Settings
- Remote Control
- Image Redirection
- Power Control
- Miscellaneous
- Maintenance
- Sign out

Menu bar

3.2 Quick Button and Logged-in User

The user information and quick buttons are located at the top right of the Web GUI.

Sync: Click the button to synchronize with latest chassis state.

Refresh: Click the button to reload the current page.

Language: Click the option to change the language (English, Traditional Chinese or Simplified Chinese) for Web GUI.

User Information: This option shows the logged-in user name and privilege. Click **Profile** to view more information. Click the **Sign out** to log out of the Web GUI.

3.3 Dashboard

The Dashboard displays the overall information about the status of the device.

Dashboard Page

Firmware Information

The Firmware Information displays the following information.

BMC Firmware Version: Displays the BMC firmware version of the device.

BIOS Firmware Version: Displays the BIOS firmware version of the device.

ME Firmware Version: Displays the ME (or PSP) firmware version of the device. Microcode Version: Displays the microcode version of the device. CPLD Version: Displays the version of CPLD of the device.

Note:

BIOS version, ME (or PSP) version and Microcode version will be refreshed when the system POST, please restart the system if you see nothing on screen.

Network Information

The Network Information of the device with the following fields is shown here. Click **Details** to view more information.

MAC Address: Read-only field shows the MAC address of the device.V4 Network Mode: The v4 network mode of the device can be either static or DHCP.IPv4 Address: The IPv4 address of the device can be static or DHCP.

V6 Network Mode: The v6 network mode of the device can be either static or DHCP. **IPv6 Address**: The IPv6 address of the device can be static or DHCP.

Sensor Monitoring

Here lists all the available sensors on the device with the following information. **Status:** This column displays the state of the device.

- Critical State

- Not Available

Sensor Name: Displays the name of the sensor. **Reading:** Displays the value of sensor readings.

Event Logs

Here displays a graphical representation of all events and occupied/available space in logs. Click **Details** to view more information.

3.4 Sensor

The Sensor Readings page displays all the sensor related information. To open the Sensor Readings page, click **Sensor** from the menu. Click on any sensor to show more information about that particular sensor, including thresholds and a graphical representation of all associated events.

External User Services Page

3.7.2.1 LDAP/E-directory Settings

LDAP is an Internet protocol that BMC can use to authenticate users. If you have an LDAP server configured on your network, you can use it as an easy way to add, manage and authenticate web users. This is done by passing login requests to your LDAP Server.

LDAP/E-directory Settings Page

General Settings: This page is used to configure LDAP/E-Directory settings.

eneral LDAP/E-directory Settings	Home > Settings > External User Settings > LDAP/E-directory Settings > (General LDAP/E-
0

General Settings Page

Enable LDAP/E-Directory Authentication: Check the box to enable LDAP/E-Directory

authentication.

Encryption Type: Select the encryption type for LDAP/E-Directory.
Common Name Type: Select the Common Name Type for LDAP/E-Directory.
Server Address: The IP address(IPv4 or IPv6) of LDAP/E-Directory server.
Port: The port of LDA/E-Directory server.
Bind DN: The Bind DN is used during bind operation, which authenticates the client to the server.
Password: The password of LDA/E-Directory server.
Search Base: The Search base tells the LDAP server which part of the external directory tree to search. The search base may be something equivalent to the

organization, group of external directory.

Attribute of User Login: To find the LDAP/E-Directory server which attribute should be used to identify the user.

CA Certificate File: To identify the certificate of the trusted CA certs.

Certificate File: To find the client certificate filename.

Private Key: To find the client private key filename.

Role Groups: This page is used to add a new role group to the device. Alternatively, double click on a free slot to add a role group.

None) to assign to this role group.

KVM Access: Check the box to enable KVM access for the group.

VMedia Access: Check the box to enable VMedia access for the group.

3.7.2.2 Active directory Settings

An active directory is a directory structure used on Microsoft Windows based computers and servers to store information and data about networks and domains. Active Directory allows you to configure the Active Directory Server Settings. The displayed table shows any configured Role Groups and the available slots. You can modify, add or delete role groups from here. Group domain can be the AD domain or a trusted domain. Group Name should correspond to the name of an actual AD group.

Active directory Settings Page

General Settings: This page is used to configure Active Directory general settings.

This page is used to configure remote session configuration settings.

Remote Session Page

KVM Single Port Application: Check the box to enable single port support when using JViewer(Java KVM). On changing this configuration, KVM and VMedia Sessions will be restarted. If this support is enabled, KVM session will not use its dedicated port whereas both Web and KVM sessions will be established only via Web Port. If this support is disabled, KVM and Web sessions will use their own dedicated ports respectively.

Enable KVM Encryption: Check the box to enable KVM Encryption for the next redirection session when using JViewer(Java KVM). If KVM Encryption is enabled, the KVM session will use the Secure port.

Keyboard Language: This option is used to select the keyboard supported languages for both H5Viewer(HTML5 KVM) and JViewer(Java KVM).

Retry Count: This option is used to retry the redirection session for certain number of attempts.

Retry Time Interval(Seconds): This option is used to give time interval for each attempts.

Automatically OFF Server Monitor, When KVM Launches: Check the box to enable Automatically OFF Server Monitor, When KVM Launches.

Note:

It will automatically close the existing remote redirection either KVM or Virtual media sessions on Single Port enable/Disable or KVM Encryption Enable/Disable.

DNS Configuration Page

DNS Enabled: Check the box to enable the DNS support.
mDNS Enable: Check the box to enable the mDNS support.
Host Name Settings: Choose either Automatic or Manual settings.
Host Name: It displays host name of the device. If the Host setting is chosen as Manual, then specify the host name of the device.

BMC Interface: To register the BMC through the Interfaces.

Register BMC: To register BMC through registration method.

Registration Method: To register the BMC are through **NS Update** or **DHCP Client FQDN** or **Hostname.**

TSIG Authentication Enabled: Check this box to enable TSIG authentication while registering DNS via Nsupdate. Separate TSIG files can be uploaded for each LAN interface.

Current TSIG Private File: The information of Current TSIG private file along with its uploaded date/time will be displayed (read only).

New TSIG Private File: Browse and navigate to the TSIG private file, the file should be of private type.

Domain Setting: Select whether the domain interface will be configured manually or automatically.

Domain Interface: This field will be present if specify **Domain Setting** to **Automatic**, the field is used to display the domain interface of the device.

Domain Name: This field will be present if specify **Domain Setting** to **Manual**, the field is used to specify the domain name of the device.

Domain Name Server Setting: Select whether the DNS interface will be configured manually or automatically.

DNS Interface: This field will be present if specify **Domain Name Server Setting** to **Automatic**, the field is used to specify the interface to be used.

IP Priority: This field will be present if specify **Domain Name Server Setting** to **Automatic**, the field is used to select the IP Priority. If IP priority is IPv4, 2 IPv4 and 1 IPv6 DNS servers are used. If IP priority is IPv6, 1 IPv4 and 2 IPv6 DNS servers are used.

DNS Server 1, 2 & 3: This field will be present if specify **Domain Name Server Setting** to **Manual**, the field is used to specify the DNS (Domain Name System) server address to be configured for the BMC.

3.7.7 PAM Order Settings

This page is used to configure the PAM ordering for user authentication.

O Sync ♀ Refresh	English v	
of Home >	Settings > F	PAM
		O Sync C Refrach English + ▲ Home - Sattings -

PAM Order Settings Page

PAM Authentication Order: It shows the list of available PAM modules supported in BMC. Click and Drag the required PAM module to change its order.

Note:

- 1. It is recommended not keeping the same username for different PAM modules.
- 2. If Authentication fails, the reason for failure could be invalid user or invalid password.
- 3. If Radius Authentication fails, we can't differentiate whether it is invalid user or invalid password. So it is always treated as Invalid username error and PAM will try other Authentication Methods.
- 4. If AD contains secret username & password as empty, Authentication fails will be always treated as Invalid Password error. For Invalid Password error PAM will not try other Authentication Methods. So it is recommended keeping AD in the last location in PAM order.

3.7.8 Platform Event Filter

Platform Event Filter (PEF) provides a mechanism for configuring the BMC to take selected actions on event messages that it receives or has internally generated. These actions include operations such as system power-off, system reset, as well as triggering the generation of an alert.

Platform Event Filter Page

3.7.8.1 Event Filters

This page is used to configure Event filters. You can modify or add new event filter entry from here. By default, 15 event filter entries are configured among the 40 available slots.

LAN Destination Configuration Page

LAN Channel: Displays LAN Channel Number for the selected slot (read only).LAN Destination: Displays ID for setting Destination Selector of Alert Policy (read only).

SNMP Destination Address: Destination type can be either an SNMP Trap or an E-mail alert. For E-mail alerts, the four fields - SNMP Destination Address, BMC User

Name, Email subject and Email message needs to be filled. For SNMP Trap, only the SNMP Destination Address has to be filled.

BMC User Name: If Destination type is Email Alert, then choose the user to whom the email alert has to be sent.

Email Subject & Email Message: These fields must be configured if email alert is chosen as destination type. An email will be sent to the configured email address of the user in case of any severity events with a subject specified in subject field and will contain the message field's content as the email body. These fields are not applicable for 'AMI-Format' email users.

3.7.9 Services

This page is used to displays the basic information about services running in the BMC.
